How Harvestgreen’s test works

- 50 training schedules tested vs baseline with no training and no focus
- Each schedule ran for one season: 100 matches in 12 months, about two a week
- The player: age 18, every attribute 8, Professionalism and Ambition 12
- Two-footed, 180 cm, 70 kg
- PA is 130 or 150: the Chinese and English notes differ
- The club: all coach attributes 16, training facilities 20
- 4-2-4 formation with 4 forward, 2 midfield and 4 defensive players
- Double intensity when condition is good or excellent, otherwise no schedule
- No morale, injuries
- Every schedule except the baseline uses the Quickness focus

Total CA growth

#	Schedule	CA	Weighted gain
1	Light Conditioning + Conditioning + Attacking Ball Work + Defensive Ball Work	33.3	**1.98**
2	Conditioning + Attacking Ball Work + Defensive Ball Work	32.5	**1.94**
3	Attacking Ball Work ×3	32.0	**1.94**
4	Heavy Conditioning + Attacking Ball Work + In-Possession Shape	32.3	**1.93**
5	Conditioning + Attacking Ball Work	31.1	**1.92**
6	Conditioning + Attacking Ball Work + In-Possession Shape	32.0	**1.88**
7	Light Conditioning + Conditioning + Attacking Ball Work	31.9	**1.86**
8	Heavy Conditioning + Attacking Ball Work	31.0	**1.82**
9	Conditioning + Defensive Ball Work + Recovery	30.9	**1.79**
10	Conditioning + Defensive Ball Work	30.3	**1.79**
11	Conditioning + Defensive Ball Work ×3	29.9	**1.77**
12	Defensive Ball Work ×3	29.9	**1.73**
13	Heavy Conditioning + Defensive Ball Work	29.3	**1.71**
14	Conditioning + Attacking Ball Work + In-Possession Shape + Recovery ×7	28.2	**1.71**
15	Light Conditioning + Heavy Conditioning + Attacking Ball Work + In-Possession Shape	29.5	**1.70**
16	Conditioning + Defensive Ball Work + Line of Engagement + In-Possession Shape + Defensive Positioning	29.0	**1.70**
17	Light Conditioning + Attacking Ball Work	26.9	**1.67**
18	Conditioning + Defensive Ball Work + Defensive Positioning + Defensive Block	29.3	**1.66**
19	Conditioning + Defensive Ball Work + Line of Engagement + In-Possession Shape	28.6	**1.66**

Repeating sessions doesn’t add much, if anything

What does training do in FM27?

- It directs where growth in CA goes into the attributes
  - Training is a distribution mechanism, not a growth mechanism
- It does not cause growth in CA, other stuff does that
- It causes player fatigue and injuries
- It maybe affects player morale, but not much
- **MAYBE** training also now leads to increased tactical effectiveness and therefore more winning
  - Harvestgreen's work so far says it doesn't

A guess at the calculations

Calculated monthly for every attribute for every player

‘Did pace go up this month’ =

% of general training focus on it (not total amount of training done on it)

- x Individual training focus on it
- x Attributes of coach allocated to pace (i.e. fitness coach) – maybe coach = ceiling to development?
- x Random number

Then perhaps all of that is compared to a calculation of ‘did the player’s CA go up this month’ to see if there is any CA left to allocate, again with some randomness

‘Did CA go up this month’ =

Training facilities

- x Age factor (16-18 highest, 19-24 higher, lower/zero after that. GKs cap out around age 27 not 24)
- x Minutes played (blocks of 5 minutes, maybe?)
- x Average CA of opponents in minutes played
- x Player hidden ratings (mainly professionalism, maybe ambition / others as well but much less so)
- x Player condition / injuries
- x Random number

Tactical training wins more, with more injuries

Average of 3 seasons	A No TE sessions	B 8 TE a month	C 24 TE a month	D Assistant manager
Actual points	63.7	68.0	**69.3**	50.0

Another tester went through FM27's training code

C

@comment 3 days ago

Really appreciate the breakdown, and credit to Harvestgreen for all the testing. I've dug through FM27's training code and run controlled tests using the game's native training code. A few findings that might help:

- Training affects both the amount and direction of development. A light schedule captures most of the gains, though extra sessions still help some ages and positions. I couldn't find the “percentage of total sessions” calculation suggested around 9:40.

- I'd put those three development sessions together on one day. Full Rest days skip training-injury checks. Across 5,888 runs of a 36-day test, grouping the same sessions reduced training-injury risk from 13.8% to 4.0%, with almost identical development.

- Tactical effectiveness showed a measurable benefit in my match tests. Raising the training component across all eight areas from 50 to 100 gave around +0.15 points per match and +0.18 xG difference across 800 seed blocks. Those numbers come from a controlled setup, so the size of the benefit will vary.

- Eight tactical sessions per month looks too light. Each session covers one area, and older lessons fade. An established setup needed roughly seven rotating sessions per week, after building a buffer, to keep every area's training contribution above 80. The overall effectiveness percentage also includes other factors.

- My pick for balancing development and tactical learning would be 3 Individual Development + 8 tactical sessions per week, one for each area, with individual Quickness for outfield players. I'd pack those 11 sessions into four days to preserve full Rest days. The additional training days still carry an injury cost.

- A surprising result: leaving IP unassigned and using only an OOP training role alongside Quickness gave the strongest overall CA growth in my tested young outfield profiles. Defensive Midfielder worked best for defenders, wing-backs and DMs; Attacking Midfielder for the remaining midfielders, wingers and strikers. Speed growth stayed similar, while other attributes, especially Anticipation, improved more. For keepers prioritising Agility/Reflexes, I'd leave both roles unassigned and use the combined Reflexes/Anticipation/Positioning/Agility focus.

- One small correction on CA costs: an acceleration weight of 10 goes through the full positional calculation; it doesn't directly mean 10 CA for one visible attribute point.

Hope that helps with the tactical effectiveness follow-up. Happy to share the test details.
